

Innovating a Better Way to Keep Caustic Clean

Cleaner. Safer. Smarter.

Cleaner Caustic. Better CIP. Reduced Downtime.

Cleaner Caustic, Better Performance

Solids contamination in caustic can compromise your entire CIP process. The S Series solves this by continuously removing solids in real time, ensuring your caustic stays clean and your system stays efficient. Cleaner caustic improves spray ball performance, keeps heat exchangers free of buildup, and reduces microbial risk in fermenters. The result? A more consistent clean, less downtime, and improved plant performance from top to bottom.

Built for Safety and Savings

Confined space entries and manual tank cleaning come with risk and cost. The S Series minimizes both by reducing solids buildup before it starts. That means fewer clogged lines, less labor, and improved worker safety across your facility.

Engineered for Easy Integration

The S Series is a fully skidded, automated solution designed for ethanol plants. It has a compact footprint and a plug-and-play configuration for fast installation with minimal disruption. Smart controls manage solids removal automatically, providing cleaner caustic with reduced foaming. The result is a low-maintenance system that reduces operator burden and helps your team stay focused on production.
